

Elk Project

This Elk Project was definitely something that I've never experienced before. In the process of making machines and networks, I learned how everything connects behind the scenes. What was most notable for me was learning the different ports and how they respond or won't respond if configured incorrectly. I explored ssh'ing from port 22 which allowed me to hop from machine to machine, while also learning how port 80 makes it possible for communication between web servers and the actual web.

In this project, I was also able to log data from port 5601 to reach Kibana. This was probably one of the things that took me the longest to figure out. Overall, this project expanded my thinking by searching outside the norm. I'm excited to learn even more in the near future projects.
